the phrase: "This is natural." Children are not spaced, for normally a man resumes intercourse with his wife the second or third month after childbirth. Except for the drinking of coconut milk and salt, which is believed to be effective in preventing conception if taken before intercourse, contraceptives are not known to women, which means that pregnancies follow in rapid succession. Families are not too large, however, despite this, those numbering seven or eight children being rare, even in the hills. The reason for this is a high incidence of infant mortality, which is obvious despite the absence of vital statistics. Abortions are usually resorted to by young women, who sustain the operation done by the uncertain skill of an old woman, in the fear that bearing a child will later stand in the way of a desirable legal marriage. Some men, however, take the precaution of placing a grain of native salt on the tongue while having intercourse during an illicit affair, believing that this will be effective in preventing conception.

A childless woman first goes to a *vòdun* priest, to have him determine by divination if a co-wife has not invoked magic against her. If her question receives an affirmative answer, she acquires a "counter-charm" to offset the effect of the other woman's magic. Should such a charm be ineffective, she would offer her prayers before the shrines of the saints and make pilgrimages to such sacred places as Saut d'Eau, there phrasing her petition to the Virgin in some manner such as the prayer overheard as a woman lighted a candle and held it in her hand before placing it on a sacred rock:

"Vièrge Miracles, Manman, voilà, depuis six ans depuis qui moins marié; moin apé vivre seul avec pauvre malheureux moin-a. Ça fait trois fois moin vini nan pié ou. Pas 'blié mandé moin fait ou, pour charité, moin ou petit pitite. Moin va minnin li ba ou. Moin apé parti, Manman, s' ou' pli, songé ça pitite m' mandé ou.—

XI

DOMESTIC LIFE OF THE PEASANTS

HAITI apparently has more women than men. This is not merely the casual impression of visitors, but a general conviction among local scholars and priests who know the country intimately. There is no census, of course, so that an investigator lacks means of confirming an unusual biological situation in which, it is said, there are five women to four men, in which many more girls than boys are born, and in which the death rate is higher for females than for males.

During slavery, more men than women were imported into the colony, but the slaughters of the insurrection and the revolution more than balanced the two sexes. The colonial census of 1790, probably inaccurate, showed 452,000 blacks and 28,000 affranchis who had some degree of Negro blood; a census of 1805, which certainly could not have been more than an estimate based on reports of plantation overseers and army officers, reported only 380,000 Haitians. This would indicate a staggering loss of 100,000 within fifteen years. Even with a reasonable juggling of the figures, it is obvious that deaths increased during the troubled years, and obviously males rather than females met their death on battlefields. Commentators on Haiti under Dessalines already speak of the preponderance of women. Other writers during the nineteenth century expressed the opinion that women outnumbered men, but the only figures offered were those in one parish for 1821–26—possibly atypical even if the figures are accurate—showing that 1,305 girls were born as compared with 1,209 boys.[1]

Certain physicians whose practice takes them into country districts and also certain priests have stated their belief that the number of females born exceeds the number of males. Although these men are in a good position to judge, the statement remains an opinion not yet validated by statistics; if it should prove true, it would be an extraordinary biological freak.[2] Another observation must be set

1. These are the figures of Charles Mackenzie, *Notes on Hayti*, II, 118.

2. One physician thinks that the rate would be as high as five girls to three boys in a few parishes; and a priest recounts his experiences in baptizing girls named "Assez-filles" (Girls-enough), so called by their parents to indicate to deity that the next child should by rights be a boy. Professional observations such as these merely corroborate the general opinion as to the excess of females in the population.

the market, the women sit all day in the broiling sun, and in Port-au-Prince at least, sometimes sleep near by for the night, in order to complete their purchases and sales and to get their fill of companionable gossip. They are often accompanied by the youngest of their children, some of whom have to be carried.

Some observers profess to see evidences of a matriarchate among the peasants, for as a general rule the woman attends to the business dealings of the market place, handles the money, directs her children, and manages the household. If the man has more than one placée spouse, complete control of the farm is the woman's during the absence of her man. It is a superficial judgment, however, to speak of the peasant mother as a matriarch. The man owns the land, chooses his women, calls for help at the moment he pleases for preparation of the ground for planting; and when he knows his end to be near, summons all his families and disposes of his property as he sees fit. His decision is final. But he is no more a patriarch than his woman is a matriarch: they are economic partners in a struggle for existence.

By our standards, the woman is inferior to the man not only in rights but in being one spouse of several. He may contract several unions, while she may have only one. She does more steady, if not more actual, physical labor than the man. When he is at home, she must offer him the best of the food. As usual in simple societies, however, the issue rarely arises as to superiority or inferiority of the sexes. Customary behavior is followed without much question.

There is one great contrast between élite and peasant women, in the matter of childbirth. The élite mother takes as much care of herself during pregnancy and parturition as would an American woman in well-to-do circles. The peasant mother, on the contrary, cannot allow herself the luxury of medical attention, nor can she spare the time to rest quietly. Like many so-called "primitive" women, she apparently finds herself little incommoded either by pregnancy or birth. Babies are born frequently in the market place, the mother having come down from the hills only that day with her goods. It is not unusual to hear of the birth of a child in a roadside ditch or in a grove by the path to and from the market town. The care given mother and infant is primitive: the navel cord is cut with a sharp stone or a piece of broken glass; a short rest is thought sufficient before the mother resumes her task. As might be expected, the death rate from infection is high and women age prematurely.

Parents are generally kind to their children, so far as physical

Besides the figures given above must be set there of the government

budget, which is annually in the neighborhood of $7,000,000, and of its annual imports and exports, neither of which generally exceeds $10,000,000 a year. Chicago, with its population of three million, has an annual budget of about $275,000,000, aside from state and federal services.

To care for all the needs of three million people in Haiti there is a sum of money less than that available annually to several of our American universities. Out of the seven million dollars must come all salaries of officials, legislators, judges, policemen, schoolteachers; the wages of all janitors and day laborers employed by the government; the upkeep of all schools, roads, lighthouses, experiment stations; the maintenance of such important public services as health, sanitation, education, soil development, reforestation. Since there are few towns, practically every improvement which takes place must be paid for by the central government.

Haiti's growth in population is not a new thing. It has been increasing steadily since 1804 while the soil of the country was being worn out and foreign trade grew stagnant. The country is entirely agricultural, there being absolutely no manufacturing industry worth the name. The people consequently live upon a subsistence economy. The soil is still fertile enough to preserve life in the teeming population, though undernourishment is general. Most of the people have no "artificial" wants and could not satisfy them under present conditions even if they had.

Assuming the census of Dessalines in 1805 to be even approximately accurate, the population is now eight times what it was then. The working of the Law of Population[1] is implacable: if population increases while economic efficiency remains static or declines, either there will be an increasing death rate or the standard of living must sink—or both. In the case of Haiti, economic efficiency is certainly not what it was under the forced-labor system of Dessalines: the death-rate has been continuously high; it is the standard of living which has suffered.

To grasp the import of Haiti's problem of overpopulation one

1. "Population tends to increase up to the limit of the supporting power of the land, relative to the economic efficiency and to the standard of living of the people at the time." (For an amplification of this discussion on overpopulation, see the note on p. 320.) The law of population as stated here is a modification of that given by Sumner and Keller, *The Science of Society*, I, 46; their statement, in turn, is that of Malthus with the added cultural terms of economic efficiency and the standard of living.

est. It was brought over from Africa apparently as early as 1509.[7] Oviedo describes it in 1526 as "a terrible pustular disease."[8] It so closely resembles syphilis that it has often been mistaken for that malady.[9] Untreated or wrongly treated it ravages the bodies of its victims, making them loathesome to behold. In the neighborhood of Port-au-Prince the Rockefeller staff found, out of 2,564 persons examined, 78 per cent affected with yaws. What is even more disturbing is that the young are afflicted. Dr. Lhérisson's investigations in one district revealed that 61.1 per cent of the cases were of children under ten.

An American, Dr. Paul Wilson, in 1922 first called yaws the primary physical curse of Haiti. He insisted "that the first need of rural Haiti was soap, salvarsan, and sunshine, and that the good Lord would furnish the sunshine."[10] The Haitian government immediately began to spend large sums to combat the disease. In the Jacmel region in one year (1925–26) 167,267 cases of yaws were treated; in 1926 over 200,000 injections of arsenicals against the disease were administered throughout the republic; and by 1931 the Public Health Service had given in twelve years 2,655,386 injections. Progress has been swift, but the fight against yaws is one which has to be waged continually.

It would probably be not far from the truth to say that for two centuries the majority of Haitian Negroes have been afflicted to a greater or less degree with malaria, hookworm, and yaws, either singly or together. Next to these dire diseases comes a group which seems to have affected from a tenth to one half the population: tuberculosis, dysentery, enteritis, and granular conjunctivitis. Tuberculosis progresses rapidly when it appears. The people have never developed a specific immunity to it, and promiscuous sex relations play their part in spreading the disease by contagion. In seven hundred autopsies performed in one year at the General Hospital of Port-au-Prince, twenty-six per cent of the deaths were due to tuberculosis. Spring water in the country districts is frequently pol-
